So by the counting principle there are  $4 \times 3$  ways of filling the first 2 positions. For each of these choices there are now 2 letters left and there are two ways of filling the third position. The remaining letter must then go in the last position. Thus by the counting principle, there are  $4 \times 3 \times 2 \times 1 = 4!$  possible arrangements, ie 24 of them.
